

# How to Find My System Information

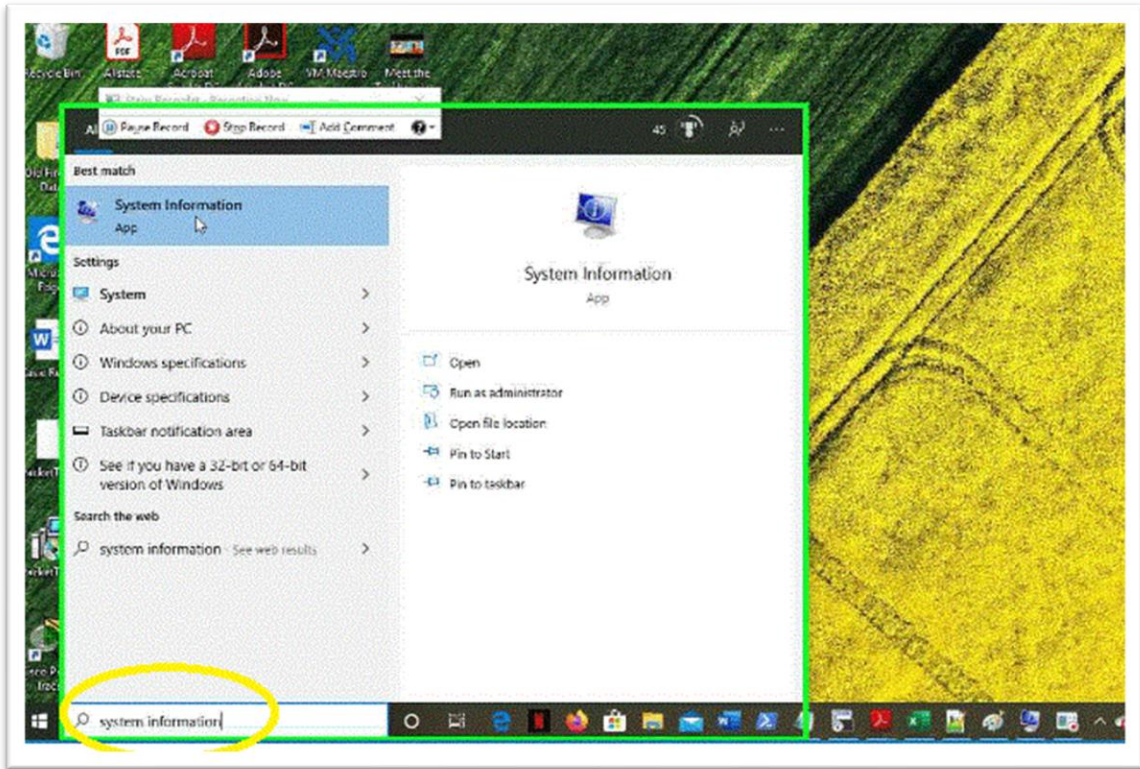

If you are looking into doing any kind of work online, it is important to find out if your system has the ability to support that work. Whether it is teaching online, working remotely, or even just facetimeing and streaming video, knowing how to check your system information will help find out if you are ready to go or if you may need to look at upgrading your system. Lets get started!

## Windows 10

1. Log onto your computer. I know this is obvious for most, but in some situations, you can pull information before you PC is fully booted up.
2. Once logged in, go down to the left-hand corner and left-click on the windows icon.

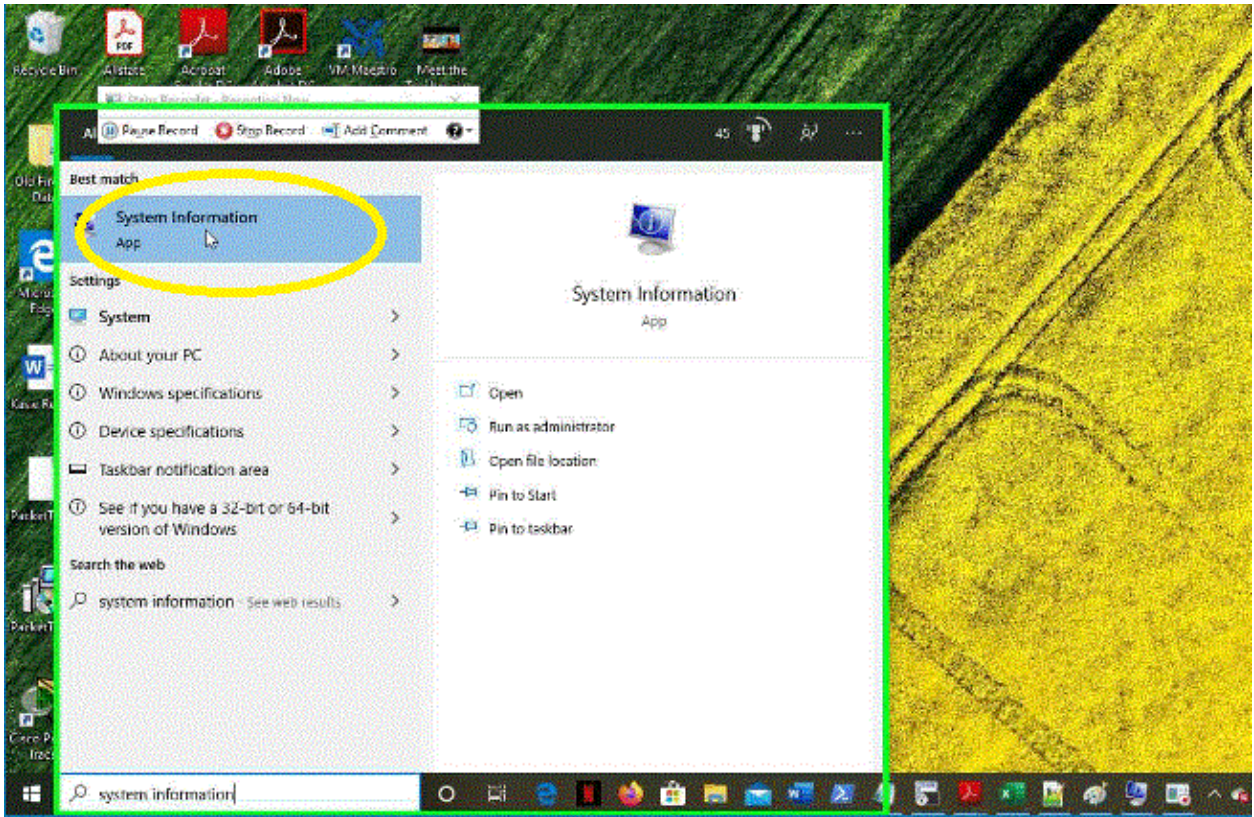

3. Type "system information". This will populate the Cortana search bar if you have it enabled.

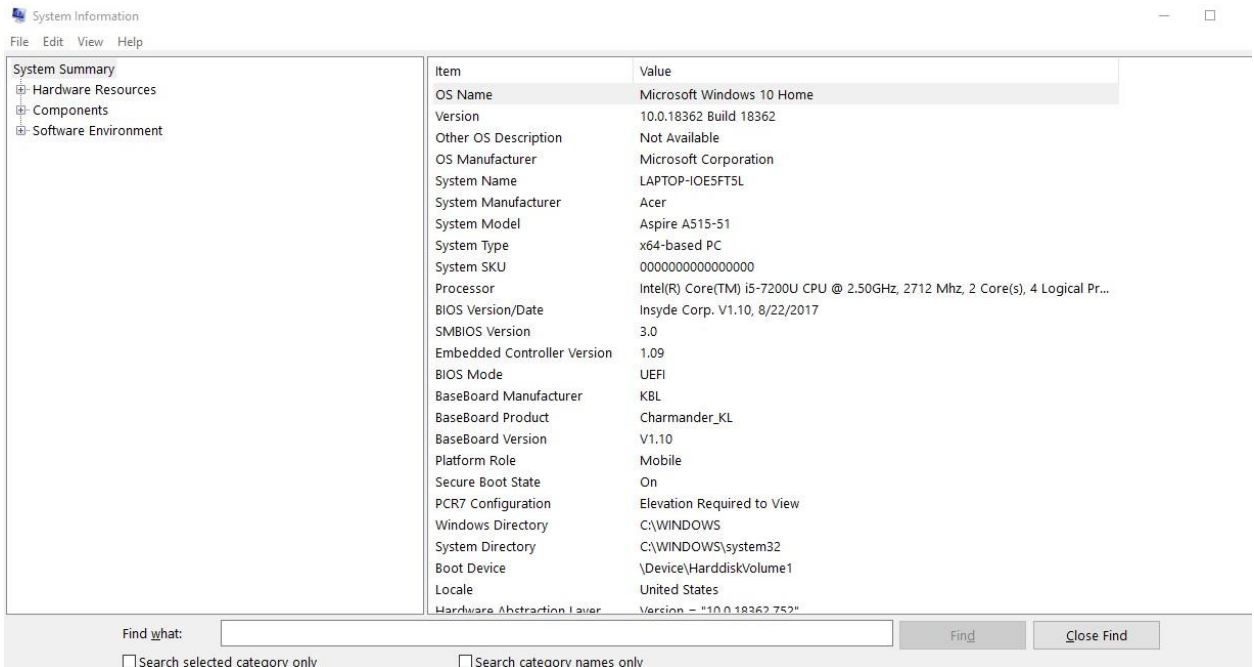

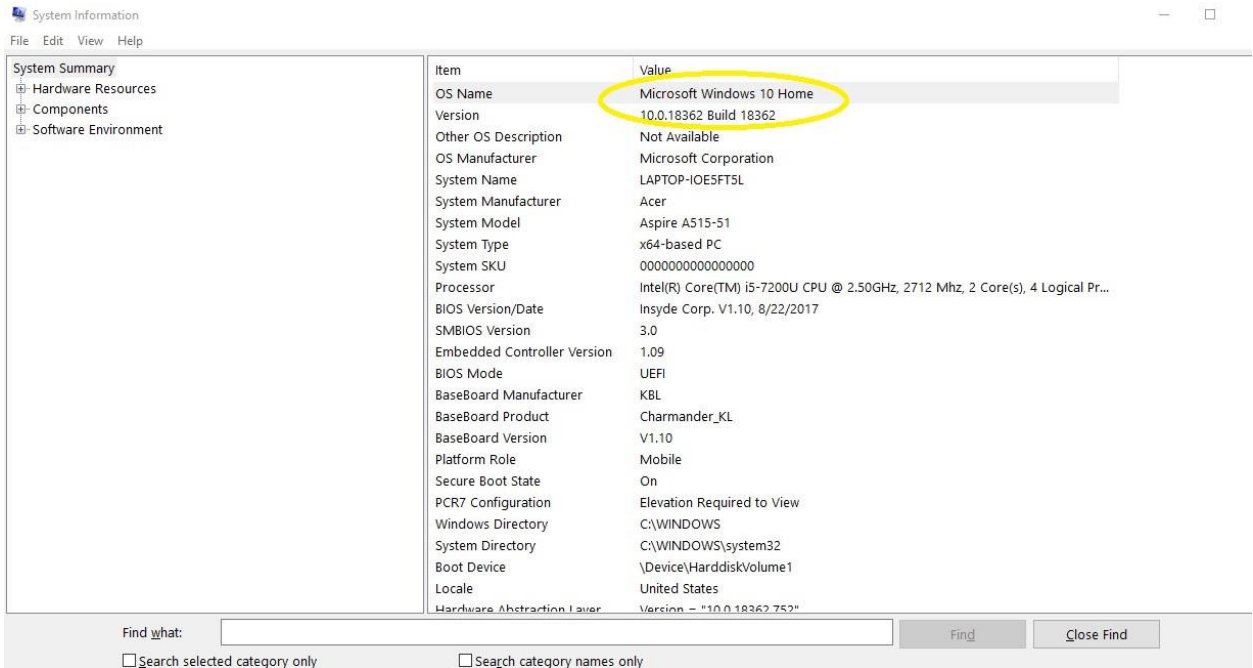

#### 4. Left-click on System Information.

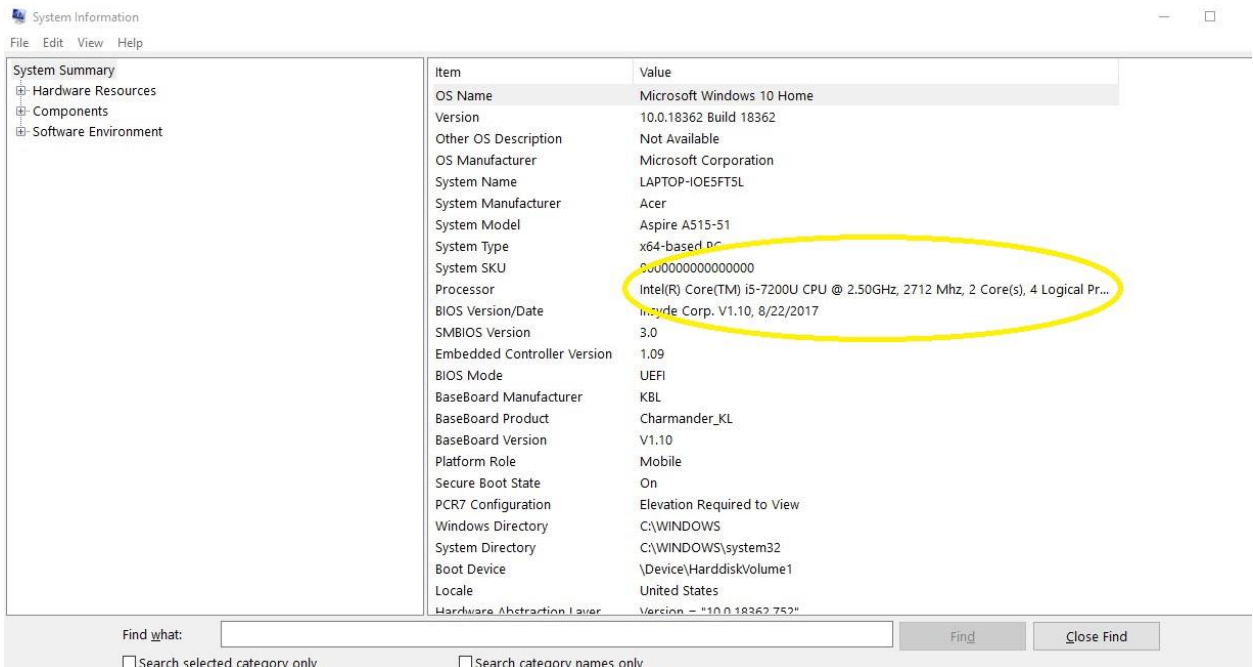

The System Information screen will appear.

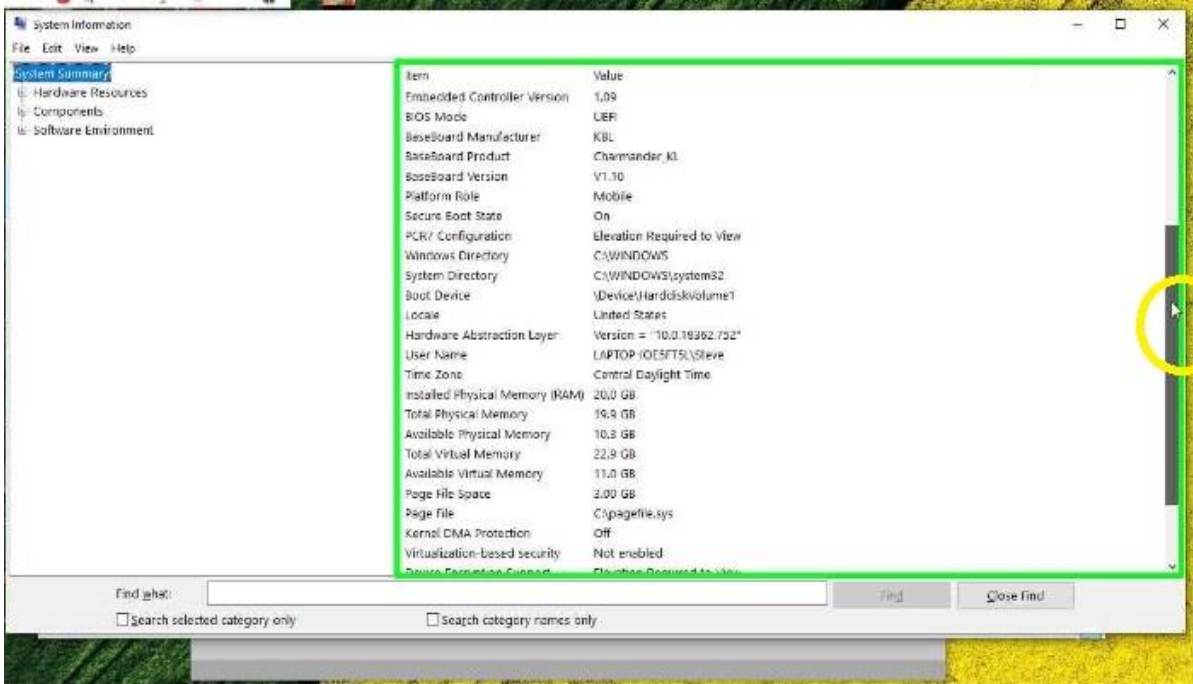

- Once the System Information window appears, look for **OS Name**. Next to it displays the Operating System you are using.

- Next go down to Processor. Next to it you will find the type of processor your PC/Laptop is running.

6. To find the amount of Memory you have you will have to scroll a little bit. So click on the scroll bar on the right and drag down about half way.

7. Look for Installed Physical Memory. This is your RAM.
